Define Problem Statements

A problem statement clearly identifies the challenges faced by users and defines the objectives of the proposed solution. It helps the development team understand user needs and design an effective AI-powered networking assistant that improves communication and networking experiences.

The following problem statements were identified after conducting brainstorming sessions and analyzing user requirements.

Problem Statement 1
Many students, fresh graduates, and professionals find it difficult to initiate meaningful conversations during conferences, seminars, workshops, career fairs, and networking events. Due to a lack of confidence and preparation, they often miss valuable opportunities to build professional relationships.
Problem Statement 2
Users frequently spend a significant amount of time searching for relevant information before attending networking events. Accessing accurate and reliable information about discussion topics is often challenging and time-consuming.
Problem Statement 3
Existing networking platforms mainly focus on connecting people but do not assist users in preparing intelligent conversation starters or improving communication before professional interactions.
Problem Statement 4
Most networking applications do not provide personalized conversation suggestions based on the event description, user profession, or networking goals, reducing the effectiveness of professional interactions.
Problem Statement 5
There is no simple web application that combines event analysis, AI-powered conversation generation, knowledge verification using trusted sources, networking session management, and feedback collection in a single platform.

Final Problem Statement
How might we develop an AI-powered Personalized Networking Assistant that analyzes networking events, generates intelligent conversation starters, verifies information using Wikipedia, stores networking history, and provides an interactive web interface to help students and professionals communicate confidently during networking events?

Objectives of the Proposed Solution

The proposed solution aims to:

- Develop an intelligent networking assistant using Artificial Intelligence.
- Analyze networking event descriptions.
- Generate personalized conversation starters.
- Verify discussion topics using the Wikipedia API.
- Store networking session history.
- Collect user feedback for continuous improvement.
- Provide an attractive and responsive Streamlit web interface.
- Improve communication confidence during professional networking events.
- Reduce preparation time before conferences and seminars.
- Demonstrate the integration of FastAPI, Streamlit, NLP, and external APIs.

Expected Benefits

For Students

- Better preparation for campus placements and career fairs.
- Increased confidence during networking events.
- Improved communication skills.

For Professionals

- Faster preparation before meetings and conferences.
- Intelligent conversation suggestions.
- Reliable knowledge verification.

For Organizations

- Improved networking effectiveness.
 - Better collaboration among participants.
 - Enhanced professional engagement.
-

Conclusion

The Personalized Networking Assistant (Smart Connect AI) addresses the common challenges faced during professional networking by combining Artificial Intelligence, Natural Language Processing, FastAPI, Streamlit, and Wikipedia integration into a single intelligent web application. The solution enables users to prepare effectively, communicate confidently, and build stronger professional relationships.
