

REQUIREMENT ANALYSIS

Data Flow Diagram (DFD) and User Stories

Date	01 JULY 2026
Team ID	
Project Name	Personalized Networking Assistant
Maximum Marks	4 Marks

1. Introduction

The **Personalized Networking Assistant (Smart Connect AI)** is an AI-powered web application that helps users prepare for networking events by generating intelligent conversation starters, verifying information using the Wikipedia API, saving networking history, and collecting user feedback.

The application follows a client-server architecture where the **Streamlit frontend** communicates with the **FastAPI backend** to process user requests.

2. Data Flow Diagram (DFD)

3. Data Stores

D1 – History Database Stores: • Event Description • Topics • Generated Conversation Starters • Date and Time Storage Format: • JSON	D2 – Feedback Database Stores: • User Feedback • Date and Time Storage Format: • JSON
---	---

4. User Stories

User Story 1
As a student
I want to enter a networking event description
So that I can receive intelligent conversation starters.

User Story 2
As a professional
I want AI-generated networking questions
So that I can confidently start conversations.

User Story 3
As a researcher
I want verified information about discussion topics
So that I can speak with confidence.

User Story 4
As a conference attendee
I want to save my networking session
So that I can review it later.

User Story 5
As a user
I want to submit feedback
So that the application can improve.

User Story 6
As an entrepreneur
I want personalized conversation ideas
So that I can connect with investors and professionals.

User Story 7
As a recruiter
I want quick networking questions
So that I can engage candidates professionally.

5. Functional Flow

1. User opens Smart Connect AI.
 2. User enters networking event description.
 3. Streamlit sends request to FastAPI.
 4. FastAPI analyzes the event.
 5. AI generates conversation starters.
 6. Conversation starters are displayed.
 7. User searches any topic.
 8. Wikipedia API returns verified information.
 9. User saves the networking session.
 10. Session is stored in **history.json**.
 11. User submits feedback.
 12. Feedback is stored in **feedback.json**.
-

6. Expected Outputs

The system provides:

- AI-generated conversation starters
 - Verified information using Wikipedia
 - Saved networking session history
 - Feedback collection
 - Interactive Streamlit interface
 - FastAPI backend services
 - JSON-based local storage
-

7. Conclusion

The Data Flow Diagram demonstrates how data moves through the Personalized Networking Assistant. The user interacts with the Streamlit interface, the FastAPI backend processes requests, the Wikipedia API provides verified information, and JSON files store networking history and feedback. The user stories clearly define the functional requirements and expected user interactions, ensuring the system meets real-world networking needs.
